Monitoring during the irradiation of BARE9
ET2p03_BARE9, plate −23.5 °C, A 1.2 / D 1.2 V supply settings; shaded = X-ray on; 1-minute medians of the campaign logs
CERN X-ray TID campaign, August 2024

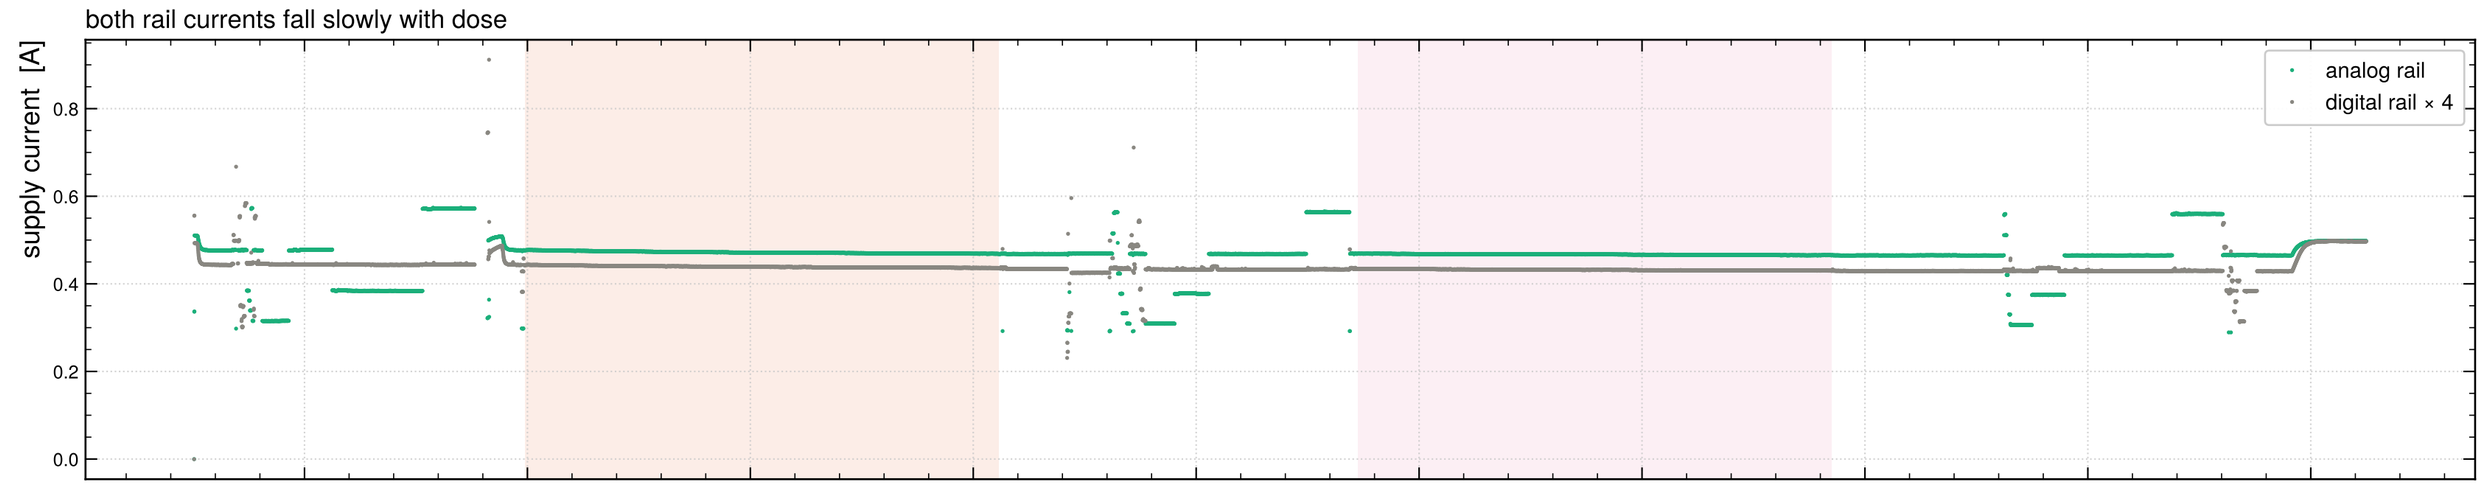

the internal reference rises through both dose steps and does not come back

the temperature-sensor pin rises during the first step at constant plate temperature

both rail currents fall slowly with dose

every autocalibration map, coloured by plate temperature (warm maps: before the cooldown, and at removal)
