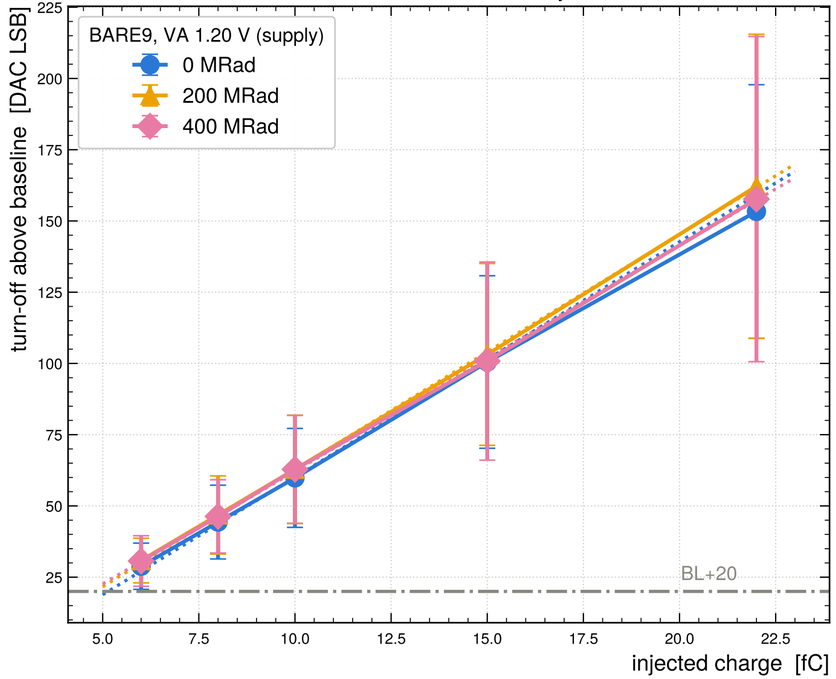
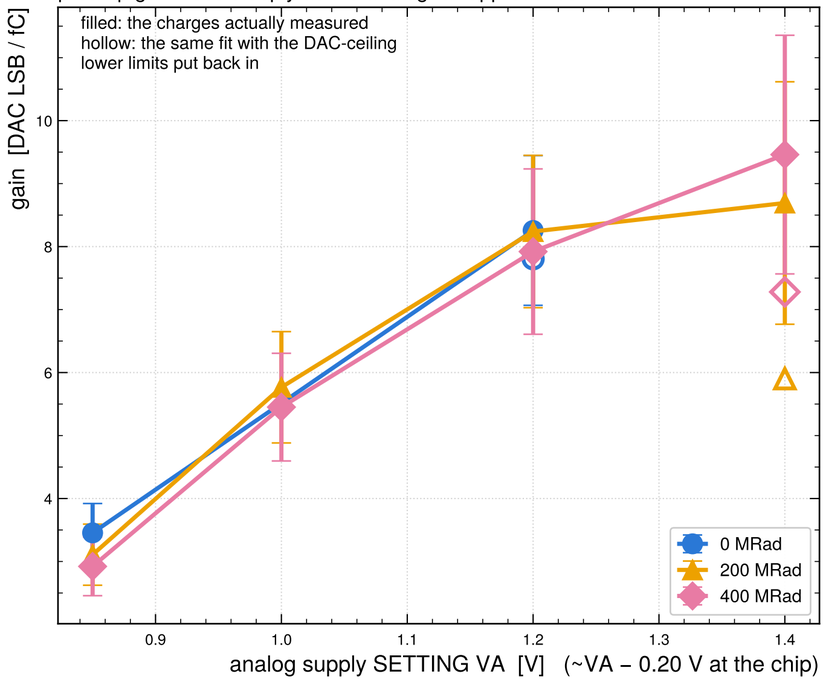
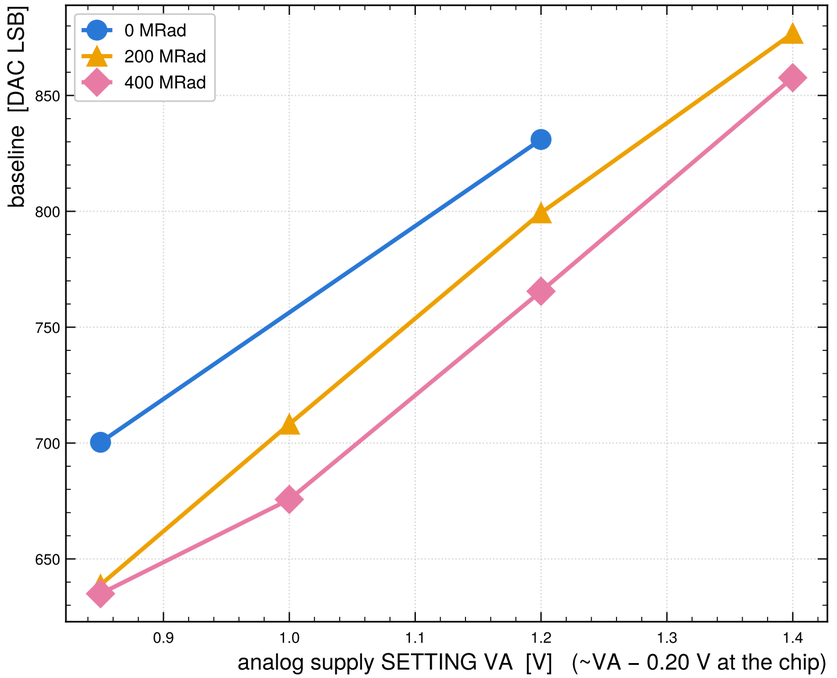
Turn-off, gain and baseline against dose and analog rail
ET2p03_BARE9, 6 pixels, VD 1.20 V (supply), −23.5 to −23.8 °C
CERN X-ray TID campaign, August 2024

referred to each condition's own baseline, dose barely moves it



preamp gain rises steeply as the analog rail approaches nominal





and so does the baseline — both are DAC-scale sensitive
